

Consolidated UX Audit Report

Comprehensive Analysis & Workflow Redesign for Wedding Invitation Process

Objective: Audit the end-to-end multi-step wedding invitation and RSVP flow to eliminate friction, resolve structural workflow breakdowns, and establish a seamless, professional user experience.

Executive Summary Matrix

Severity	Category	Identified UX Issue	Remediation Strategy
High	Workflow & State	Competing CTAs and action repetition (Accept/Decline present on every screen); broken UI states mixing read-only summaries with editable form controls.	Implement strict, linear routing. Isolate the initial attendance decision. Separate read-only confirmation views from editable form components.
High	Legibility & Accessibility	Severe contrast failures (dark text on dark dietary buttons); ultra-thin decorative serif fonts used for critical information against textured backgrounds.	Enforce minimum WCAG contrast ratios for all interactive elements. Swap decorative serifs for legible sans-serifs on form labels and smaller text.
High	Transactional Friction	Hidden ticket pricing (150 MAD) revealed late in the flow; generic, unstyled payment modal obscures context; pre-filled cardholder names force corrections.	Disclose pricing upfront on landing view. Integrate a custom-styled payment component maintaining visual continuity and leaving cardholder fields blank.
High	Post-Task Dead Ends	The final confirmation screen lacks utility, stranding users without actionable next steps after payment.	Add functional utilities immediately post-purchase, such as generating an .ics file for calendar integration or a PDF ticket download.
Medium	Visual Interference	The recurring couple illustration continually overlaps input fields and primary buttons, blocking interaction and creating visual noise.	Adjust spatial padding and component placement. Confine decorative illustrations to headers or dedicated negative space away from form controls.
Medium	Navigation Ambiguity	Contextless left/right header arrows and inconsistent back button	Standardize navigation into a persistent footer or sticky header

Severity	Category	Identified UX Issue	Remediation Strategy
		placement confuse the sense of progression.	with clear "Next" and "Back" semantic labeling.
Medium	Viewport Utilization	The fixed-width mobile card layout leaves excessive, unused white space on desktop screens.	Utilize responsive CSS Grid/Flexbox to adapt layout, displaying decorative elements side-by-side with forms on larger screens.
Low	UI Affordances	Floating "Musique" toggle sits outside the main container; status badges ("Payé") mimic exact styling of clickable action buttons.	Anchor floating elements into a global app header. Differentiate read-only badges visually (e.g., flat background, no hover state) from primary buttons.

Recommended Ideal Workflow Architecture

To resolve state management failures and overlapping UI issues, the architecture should be restructured into a strict, conditional linear sequence:

Step 1: Landing & Core Decision

Render event details, upfront pricing, and a single high-contrast CTA. Ask the core attendance question (Yes/No) immediately to capture the primary boolean state before loading further modules.

Step 2: Conditional Preferences

If attending is confirmed, route to a clean, single-purpose form component for dietary choices and allergies. Strip out heavy background illustrations to ensure maximum legibility and proper stacking.

Step 3: Review & Integrated Checkout

Display aggregated data as a strictly read-only summary. Pass the final amount to an integrated payment gateway component matching the application's dark, premium styling rather than triggering a disruptive white modal overlay.

Step 4: Functional Confirmation

Render success state with distinct, non-clickable status badges. Provide explicit action buttons to download the E-ticket or push event data directly to user calendars.
